Release-notes for Wizdom

Version 3.7.3.0

Sep. 28. 2018

Content

1. Introduction

This release contains bug fixes and improvements.

This version is tested against SharePoint 2013 (Sep 2018 CU).

REQUIREMENTS

Wizdom version 3.7.3.0 supports Internet Explorer 9 or later versions, Microsoft Edge, Chrome and Safari.

2. New functionality

COURSE AND ACTIVITY

- **Send mail:** Another option is added to the "Send mail" menu: "Organizer". When this option is selected the email is sent to the organizer (contact person) for the course. This option is now the default option.

- **Filtering in course overview:** On the overview page, an extra input field is now displayed:

This field may be used to filter the courses shown as a result of the other filters. Typing a text in the field and hitting <Enter> (or clicking the filter icon) causes the course list to be filtered by the given text. Courses are shown if the text is found in a course's Title, Additional Headline, Subject, Description or Organizer field.

WEBFORM

- **Hidden fields:** When a field is configured to be required but is hidden in the form (because it is dependant on another field) the form cannot be saved – the users cannot fill out the field, because it is hidden, and the field is required for the form to be saved.
  It now works like this: If the required field is hidden the form is allowed to be saved, even though the field is not filled out.

NOTICEBOARD

- The mails sent from NoticeBoard are now based on a template. This way it is possible to include the alternative author or other fields in the mail. See the appendix in this note for details.

3. Bug fixes

NOTICEBOARD

- NoticeBoard fails to show profile pictures if these are located somewhere else than SharePoint.

- In some cases a NoticeBoard comment is shown, even if it is supposed to be deleted.

- Error when clicking "Unread comments". This bug is also fixed in Hotfix 1 for NoticeBoard 3.7.2.0.

- Comment icon is shown in the news list web part even if comments are not enabled for the news item. Clicking this icon makes it is possible to create a comment.

- Performance problems opening news items (only when using "SharePoint Social Integration). This bug is also fixed in Hotfix 2 for NoticeBoard 3.7.2.0

- NoticeBoard configuration: If an SMTP server and a password is previously specified in the Notification settings and the settings are saved again, the password is cleared.

- Not possible to specify a port number for the SMTP server (#25 is assumed). You can now specify the port number like this: "smtp.domain.com:539".

- Showing news items occationally fail when using SharePoint Social Integration. Other attempts to solve this problem in earlier versions obviously didn't succeed.
HANDBOOK

- Archived handbook pages are shown in A-Z webpart.

COURSE AND ACTIVITY

- "Number of free seats" does not take guests into account. This is now corrected, and the number of subscribed guests is shown under "Course info".

- "Number of tree seats" are miscalculated in some other cases as well.

OTHER ISSUES

- "User Profile Properies Information" webpart fails when attempting to save properties.

- Wizdom configuration: Saving revision settings times out

4. Appendix: NoticeBoard mail template

After this update has been installed, the list "NoticeBoardViewTemplates" now contains a template named "Email". This template is used when NoticeBoard sends emails. The default template lookes like this:

```
<subject>__channelname__:
__title__</subject><body>__content__<p>__author__</p></body>
```

which makes the emails look as before this update.

This template may now be modified. The contents of the <subject> field specifies the email subject, and the contents of the <body> field species the body of the email.
The following placeholders may be used in the template:

__startdate__

__enddate__

__startdate_<format>__, e.g. startdate_d. MMM yyyy HH:mm__

__enddate_<format>__, e.g. enddate_d. MMM yyyy HH:mm__

__title__

__channelname__

__content__

__author__

__author email__

__alternativeauthor__

__alternativeauthor email__

__alternativeauthor2__

__alternativeauthor2 email__

Note:
 __alternativeauthor__ and __alternativeauthor email__ show the name and email address of the alternative author, if one is specified. If not, nothing is shown.
__alternativeauthor2__ and __alternativeauthor2 email__ show the name and email address of the alternative author, if one is specified. If not, the name and address of the regular author is shown.
